HE following notes are supplementary to an account of a journey in Eastern Tibet that appeared in the April number of the *Journal*, and accompany the map which is now published.

In 1917 the Chinese had control of a district of approximately 80,000 square miles in area (exclusive of Koko Nor). From a calculation I made then, on the basis of the number of families in the districts into which the Chinese had divided the country, I estimated the population to be about 450,000 persons, an average of less than six to the square mile. Probably more than one-tenth belonged to the celibate lama priesthood. Chinese settlers and half-castes living as Chinese were not more than 25,000 and lived almost entirely at Tachienlu, in the districts near that town and at Batang. There were also about 7000 Chinese soldiers in garrison. During 1918 the Dalai Lama recaptured Ruvoch'e, Ch'amdo and Draya west of the Yangtze.

The three principal frontier marts on the Chinese or eastern side of Tibet are Tangkar (Donkyr) in Kansu to the west of Sining, Tachienlu and Atuntzu in the north-west of Yunnan. The first, Tangkar, is outside the subject of these notes, but a few words may be of interest. This busy little town has been vividly described by Abbé Huc in his *Travels in Tartary*. The road from Tangkar to Tibet joins the north road from Tachienlu at Jyekundo. Towards the east one road leads to Lanchow, the capital of Kansu, and another branches off east of Sining and goes through Liangchow across Mongolia to Kweihwacheng, where merchandise is transported to Tientsin. Through Tangkar passes the greater part of the trade between Tibet and North China. The staple commodity is wool, of which some 2,700,000 lbs. are exported annually to Tientsin. In this trade Tangkar completely overshadows Tachienlu, a fact which is partly accounted for by the cheapness of camel transport across Mongolia. As a matter of history it may be mentioned that up to the establishment of the Manchu dynasty in China and the conquest of Tibet, intercourse between the two countries was mainly carried on by this and other roads through Koko Nor and not through Tachienlu. Other exports through Tangkar besides wool are lambskins and salt, and the principal import is barley, a necessity owing to Koko Nor being a pastoral country.

Atuntzu, a small town in the extreme north-west of Yunnan and due south of Batang, is important because it lies on a road leading from the principal towns of Yunnan to Batang and to the districts south-west of Ch'amo. Its trade is comparatively small, because Yunnan supplies neither tea nor silk and the Tibetan country beyond it is not a pastoral region. The chief export is musk.
Tachienlu owes its importance to the tea and silk which are produced in Szechwan for the Tibetan market. The means of access from the east and west are far less favourable than those of Tangkar. The latter is approached by good mule roads from Kansu, and on the west, though the road to Tibet passes through a very elevated country, there are no passes of great difficulty. On the other hand, the road from Chengtu to Tachienlu crosses a rugged mountainous country involving two steep passes of over 9000 feet altitude, a descent to the Tung River and a climb of 5000 feet to Tachienlu. The road has been improved by the Chinese, much of it being paved with stone slabs, and the ascents of the passes are flights of steps just passable by pack-animals. The Tung River is spanned at Lutingchiao by an iron suspension bridge constructed in the eighteenth century. I mentioned above that Chinese intercourse with Tibet prior to the Manchu dynasty generally passed through Koko Nor. In the earlier histories the route from Szechwan to Tibet always spoken of is a road leading westward from Sungpan, and Tachienlu is not mentioned till the seventeenth century. Locally one hears that the tea carriers formerly used a road along the Tung River westwards to its great bend at Tzutati, and thence into the Tibetan country west of the Cheto pass, finally joining the north road near Dau. The traces of their ironshod poles in the stones are still visible. It may be added that in former days the capital of the King of Chala was not Tachienlu, but a place further to the south-west.

The principal imports into Tibet from China are tea, silks, tobacco, cottons, foreign and native sundries, and rice. The latter is imported for the consumption of the local Chinese and army. Had the Szechwanese, like their countrymen of Kansu, been wheat instead of rice eaters, their attempts at colonization might have been more successful than they have actually proved. The sundries and cotton goods are also generally required by the Chinese, the Tibetans, in place of the latter, preferring woollens, locally woven or from Lhasa, or, if wealthy, silk. Tobacco is a luxury which every Tibetan now requires.

Tea and silk are the bulk of the import trade. As far as the production and transport of tea to Tachienlu are concerned, the tea trade has been exhaustively described by Sir A. Hosie in his ‘Journey to the Eastern Frontier of Tibet, 1905,’ and by other travellers. The trade has suffered greatly from the continued hostilities between China and Tibet, and imports have fallen off in recent years. To the Tibetans however tea is a necessity of life, and they have put no artificial restrictions on its importation. Judging by inquiries made at Tachienlu, Chinese tea holds its own in spite of political difficulties and is not being ousted by Indian products. The competition of India tea is not alleged as a reason for the decreased use of China tea, and probably the Tibetan trade is too small to make it worth the while of Indian planters to specialize in it.

Silk goods imported through Tachienlu are silk piece-goods, katas or ceremonial scarves, coloured scarves, and cords. They are made in
Chengtu specially for the Tibetan market. In China the favourite colour in dress is blue, but the Tibetan prefers maroon, dark red, or yellow, and these colours predominate in the silks which are imported. In figured cloths all the Chinese designs are popular, but the weavers also manufacture many Tibetan styles, bearing figures of Buddhas, pagodas, or religious emblems. The best qualities, amongst them brocades in gold thread, are fine examples of the weaver's art. The value imported in 1915 was about £20,000, and that of tea £170,000.

Tibet exports to China musk, gold, wool, skins, and medicines. Musk is the produce of a small deer which is found all over Tibet. It is easily adulterated, and experts are required to purchase it. About half a dozen firms specialize in the trade, which amounted in 1915 to £160,000. It is of sufficient importance in the European scent industry to cause two French firms to maintain themselves at Tachienlu and Atuntzu solely for this commodity. Gold is next in importance to musk. Though much is mined in the country, a large quantity is brought from India through Lhasa to pay for tea and silk. As regards wool, the scarcity caused by the Great War and the higher prices prevailing tempted merchants in recent years to bring down much larger quantities than ever before, but the boom is not likely to continue if prices fall. In former years the wool trade of Tachienlu was a mere fraction of that of Tangkar. The medicines exported are mainly rhubarb and other vegetable drugs for the Chinese market. The most interesting is the curious Chungtsao or insect grass, a dried caterpillar about 2 inches long, which has been killed by a fungus of about the same length growing out of one of its segments. It is supposed to be an excellent restorative to weak constitutions.

At Tachienlu imports and exports change hands from Chinese to Tibetans and vice versa. Till recently the handling of trade in Tibet was done by Tibetans, and though the Chinese are more and more engrossing trade in the occupied districts, that with independent Tibet is still done by Tibetans. In general it is monopolized by merchants of the eastern province, Kham, either private people trading on their own account or on behalf of monasteries, or monasteries themselves. The wealthiest merchants belong to the Horpa States.

The ordinary course of trade is this. A merchant, say at Lhasa, wishing to purchase tea and silk, assembles a caravan of ponies and mules and ladles them with Tibetan goods, such as woollen cloth, rugs, incense, foreign sundries from India, and gold and silver in bullion or coin. He proceeds to Tachienlu by the north road through Jyekundo and Kandze, selling his stock as he goes along, so that little reaches Tachienlu. Here he puts up at one of the Tsang or Kwochwang. These are the houses of the local Tibetan gentry, who undertake to entertain the merchants on condition of being their go-betweens and interpreters in dealing with the Chinese. There are commonly said to be forty-nine of these Kwochwang, but there are really only about half that number.
When business is to be arranged, the Kwochwang owner takes the merchant round to the Chinese merchants he wishes to see. In the old days the tea business was a close monopoly of a few Chinese, and the Tibetan, who usually traded with an old-established connection, was practically obliged to take what the seller offered at the latter's price. Circumstances have changed with the decrease of trade and the opening of many new Chinese firms, so that the touting is now on the Chinese side.

The Tibetan now begins to arrange his contracts. The general custom is for the buyer to pay one-half of the price on the spot in cash and to give a promissory note for the remainder. He engages to remit this balance when he next comes to Tachienlu. In the meanwhile he has been paying off old debts and purchasing sundries and silks. Cash in full is generally paid for these. The arrangement of the tea contracts is a long business which may keep the merchant some months in Tachienlu. During this time he is able if he wishes to have silk piece-goods made to his order at Chengtu.

Everything having been settled and his purchases made, the merchant collects the caravan, which has been let out to graze in the mountains, ladles it with his silks and sundries, and sets out for the return journey. The tea will not have arrived before he leaves, and he will have to arrange with the Kwochwang landlord for its packing and transport after he has departed.

The tea is brought in day by day from China, and as it comes is repacked and stored till sufficient is collected for a caravan. As delivered in Tachienlu the tea is in packages $3\frac{1}{2}$ feet long, 8 inches wide, and 4 thick, wrapped in bamboo matting. To reform for animal transport three packages are cut in half, the halves placed side by side and wrapped in raw hides, which are tightly stretched and sewn while fresh and damp. A stiff, unbreakable bale, 22 inches square by 8 thick, is thus made. It weighs about 66 lbs., and two or 133 lbs. form one animal's load. Generally all kinds of merchandise for Tibet, whether in boxes or not, are packed in a similar fashion in raw hides.

By the time the tea is ready a caravan of yaks has been hired from one of the firms who specialize in this business, and the tea is loaded on the animals and despatched. Such caravans do not make the whole journey to Lhasa, but are changed every half a dozen stages or so. They are almost always of yaks, and their slow rate of travel and the delays in changing over make the journey to Lhasa a very long one. Mules and ponies are hardly ever used for this purpose, being preferred for more valuable merchandise, such as silk and sundries. The merchant will have arrived in Lhasa long before his tea, and it may be a couple of years from the time he first set out to Tachienlu till the last consignment arrives. As regards the payment of the balance, he will settle this on his next visit to Tachienlu, and Chinese say that defalcation is a very rare occurrence.

In respect of its mineral wealth Tibet is probably the least known
country of the habited world. No scientific geological expedition has ever touched more than the fringe, and over the greater part the geological features are sketched on mere conjecture. Richthofen’s Geological Atlas of China gives some general features in South-Eastern Tibet, but only a small portion of his data is taken from direct observation.

The wide distribution of alluvial gold deposits may indicate great wealth of this metal. Gold is found in every part of the country east of the Yangtze River, but not, as far as I have heard, between the Yangtze and the Mekong. The Tibetans have a superstitious objection to removing precious metals from the earth, believing that they contribute to its fertility. The Chinese however are less scrupulous, and their activities have often led to conflicts with the natives, more especially when the gold-bearing sands lie beneath the Tibetan fields. The yield of gold is generally poor, and a Chinese would consider himself unusually fortunate if he made £150 to £200 a year. The usual method of cradle washing is employed, the concentrates being finished off with quicksilver. The discovery of a new field leads to the usual gold rush, but after a year or two the cream of the mine is skimmed off and a few stragglers remain to clear up the leavings. None of the mines I have heard of have lasted for any length of time. At the present time the most flourishing is at a place 50 miles north-east of Dau, where several thousand Chinese are engaged. It appears to be in a rich mineral district, as other ores are to be found, including native silver.

Silver is found at the place just mentioned and also near Tachienlu. In this latter mine, where gold has also been found in alluvial gravel in a fissure of the limestone, some veins of silver-bearing galena are exposed. A Chinese company worked the mine for silver for a short time, but stopped after losing money in the enterprise.

Copper has been mined for a long time at Kungkaling, to the south of Litang and west of the river Yalung. It is from these mines that the coppersmiths of Dege obtain their metal. Copper ore has also been found in Dege at Wara Gompa on the river north of T’ungpu. A mine was opened in 1910 or thereabouts, but has since been closed.

Tin is apparently not found in Eastern Tibet, for no mention of it is ever made. The white alloy of tin used in Dege in metalwork is imported from China.

Iron ore mines may exist in South-east Tibet, but none has come to my knowledge. It is probable, however, that the swordsmiths of Dege obtain their iron locally. Most of the iron utensils used by the Tibetans come from Szechwan. At Ch’amdo they are said to come from Shobando, in Tibet west of the Salween.

There is no evidence of extensive coalfields, the only mine I have heard of being a small working on the Ba River 30 miles north of Batang, which is now closed. There are however some mines east of the Tung River near Lutingch‘iao.
One useful mineral recently discovered which should be available for the foreign market is white mica, which has been found on the upper course of the Tung River 100 miles from Tachienlu near Romidrango. An enterprising Chinese was able to contract with a Hankow firm for the supply of mica sheets on marketable terms, but the war had put a stop to the works when I left Tachienlu in 1918.

The principal obstacles to modern mining enterprise in this country, apart from Chinese official obstruction, would be lack of labour and difficulty of transport. The former could no doubt be overcome by importing Chinese labour from Szechwan, but it would be quite impossible to feed them on local resources. All food would have to be brought from Szechwan. Machinery of moderate size might be brought by water as far as Chiating in Szechwan on the Yangtze, but beyond that it would have to be brought overland. The difficulties of the road to Tachienlu, which have been pointed out above, make this impossible. It is quite unlikely that any railway will be built even to Tachienlu—there is none yet in Szechwan itself—for the volume of traffic would never justify the enormous expenditure. Therefore any mining company that proposed to undertake large operations would have to build its own railway for purely mining purposes, such as the internal railways of Western Australia.

The map which is published at the end of this number of the Journal gives a detailed reduction of a route traverse I made with prismatic compass and sextant in 1916. The journey was described in the April number of the Journal. The original sheets, which are fourteen in number, are plotted on a scale of 2 miles to the inch, and record every town, village, and solitary house, and every monastery passed on the road. The average number of compass sights taken was at least two to the mile, often as much as three. The road from Gönchen to Ch'amdo had been travelled by Europeans before but not mapped; that from Ch'amdo to Batang is almost entirely new, while that from Batang to Gönchen had also never been mapped in detail. In the original sheets the shape of the country has been indicated by form lines as accurately as possible in a hurried compass traverse.

LIGHT RAILWAYS IN NEW COUNTRIES

Major W. Waters Van Ness, R.E.

I HAVE been tempted into giving the results of my experience and expressing my views on light railways through reading Colonel Napier's very interesting and instructive paper published in the January issue of the Geographical Journal on "The Road from Baghdad to Baku." I note that both Colonel Napier and Sir Valentine Chirol advocate motor transport in preference to railways for solving transport difficulties in Persia.
This map is reduced from Mr. Coates’ prismatic compass traverse plotted by him on the scale of 1 inch to 2 miles, and adjusted to his astronomical latitudes, a list of which is given below. The latitudes have been adjusted to the positions of Tachienlu, Chamdo and Batang, on the Survey of India 111,000,000 map of India and adjacent countries. The latitudes are by meridian altitude of stars (in most cases N. and S. stars) taken with a 6-inch sextant and artificial horizon. The route from Tachienlu to Dawa was not surveyed by Mr. Coates, but is taken from the map of J. Baret published in his book “Le Tibet Révolté.”

Heights are from aseroid, corrected by mercurial barometer at various points on the route.
