Silvicultural Research Division, Lahore

(Issued under the authority of the Chief Conservator of Forests, Punjab)
GRASSES OF RAWALPINDI DISTRICT, PUNJAB (PAKISTAN)

In spite of the great economic importance of grasses for food, fibre and fodder and for soil binding very few botanists have paid much attention to this group of flowering plants. As the Punjab lies largely in the arid belt stretching west to Arabia and North Africa it lacks trees, but grasses are abundant. In Rawalpindi district alone there are at least 170 species of Gramineae, and if the whole area were carefully explored more would be added to the list. Many of them have considerable economic value, and were our marginal and sub-marginal lands properly managed these could grow high-yielding crops of valuable grasses.

Rawalpindi district occupies the northernmost corner of the Punjab. It lies between 33° and 34° North Latitude and 72° and 74° East Longitude, and is bounded on the north by Hazara district of the N.-W. Frontier Province, on the east by Poonch Province of Kashmir State, on the south by Jhelum district and on the west by Attock district. There is little level land in the district at the present time, but it is evident from the geological formations that in the past much of it was a loess plain, which has gradually become more and more dissected into ravines probably because the Himalayan uplift has made it possible for the streams in the monsoon to erode the unconsolidated soil with great ease. A second reason for the present bad conditions is over-grazing together with poor management.

In the plains portion of the district there are some bare rocky ridges, outliers of the Himalayan foot-hills, and some fertile portions between the bad lands, but it is too rough and there is too little water in it to allow anything but a little well irrigation in favoured spots. Its prosperity depends on the monsoon rains.

The north-eastern corner of the district, consisting of the Murree tehsil is mountainous, running up to 7,500' elevation and this portion has a flora very different from that of the plains, though in the summer many of the weeds, which grow in the plains during the monsoon months, find it possible to grow at heights upto 7,000'. The district, however, is so far north and so far from the ocean that the rainfall here is much less than in the hill stations of the East Punjab and the United Provinces of the Indian Union. The average rainfall in Rawalpindi between June 1 and September 30 is 22.5" and in Murree 35.2". As a result of this moderate rainfall Murree lacks the luxuriant epiphytic vegetation of Mussorie and the mountains further east. The total number of species and the tropical elements in the flora are much reduced in consequence.

Because of a difference of 6,000' in altitude between the plains portion of the district and the tops of the Murree hills there is a good deal of difference
between the grass flora of the plains, the foothills and the forested mountains. The western side of the district is the driest with a large proportion of xerophytic grasses, many of them North African. In the Murree Hills there are a good many temperate species. During the monsoon many tropical and sub-tropical grasses flourish in the foot-hills and plains. Many of our grasses are widely distributed in other parts of the world.

Overgrazing is universal in the plains as well as in the hills as a result of which erosion is progressing ruthlessly, impoverishing the region. The Punjab Forest Department has shown how erosion can be checked and surplus water conserved by scientifically levelling and, terracing the ground and check-damming the ravines, but outside it few realise the urgency of the problem. In many places the soil has almost all been washed away exposing the parent rock, so that even with complete closure to grazing it would take many years for new soil to form.

As in the rest of the Punjab there are two favourable seasons when plants grow without irrigation. The first is the spring when there is an ephemeral covering of vegetation in March, which dries up in April with the onset of hot weather. Only hardy perennials and a few annuals can survive till the monsoon breaks early in July. Then the hillsides become green and more tropical types rapidly appear, which flourish in August and begin to dry in September on the close of the monsoon.

The chief cereal crops are wheat, barley, maize, jowar (Sorghum vulgare), bajra (Pennisetum glaucum), rice and sugarcane, all included in the natural order Gramineae.

As far as is known there are no grasses endemic to the area. Most of them belong to the widely distributed dry Mediterranean flora, or are widespread tropical species. Many are cosmopolitan weeds of cultivation. A few are temperate grasses. There is only one indigenous bamboo (Dendrocalamus strictus) but it is not common.

There has been little collecting of grasses in this tract. The only important collection is at the Gordon College, Rawalpindi. The few numbered specimens in the Dehra Dun Herbarium were collected by J. E. T. Aitchison (1870) and by Gen. Wingate, and references to some grasses are found in J. L. Stewart’s publication Punjab Plants (1869). About 1851 Dr. Fleming collected specimens of grasses in the Salt Range and Murree Hills, but no reference to this collection has been traced. A number of Murree grasses collected by E. W. Trotter more than 60 years ago are in the Gordon College Herbarium as are the writer’s own specimens and those collected by Professor Mohinder Nath Nayyar and Professor Eugene Nasir. Very recently Mr. A. G. Bhatti was deputed by the Forest Department to work on hill grasses and he studied those found near Tret at about 3,000’ elevation. Mr. R. N. Parker, I.F.S., a Chief Conservator
of Forests of the pre-partition Punjab, was interested in grasses, and some Rawalpindi specimens collected by him are probably at Dehra Dun. The writer's is the first attempt to bring together a complete list of the grasses of the region. It includes a few species collected in adjacent districts which, from the absence of any important barriers, may probably be found in Rawalpindi district with further exploration.

There is no up-to-date book which can be recommended to a student who may wish to master Punjab grasses. The seventh volume of the Flora of British India gives useful information, but it is out of date and many of its species have been given other names in more up-to-date floras due to the splitting of large unmanageable genera like Panicum and Andropogon into more manageable units.

**Bibliography**

Stewart, R. R. .. The Grasses of Northwest India, Brittonia 5, No. 4, 1945.

Mahendru, I. D. .. Grassland Survey in the low hills of the Kangra district, Punjab Forestry Notes, No. 10, June 1945.

Post, G. E. .. Flora of Syria, Palestine and Sinai, Revised Ed. 1933

Parker, R. N. .. Forest Flora, Ed. 2, 1924.

Collett, H. .. Flora Simlensis, 1902.

Duthie, J. F. .. The Fodder Grasses of Northern India, 1888. This is an old book, but it is a mine of information as no one has done as much work as he on the grasses of North India.

R. R. STEWART (Dr.)

Late Principal, Gorden College, Rawalpindi

Edited by Khan Fazl Muhammad Khan, I.F.S. (Retd.) Divisional Forest Officer, Silvicultural Research Division, Punjab.

Note—1. The alphabetical list appended to Dr. Stewart's Catalogue of Grasses has been prepared in the office of the Silvicultural Research Division, Punjab.

2. The star-marked grasses are described in Ind. For. Records (Botany).

Lahore

June 1950
CATALOGUE OF GRASSES COLLECTED IN RAWALPINDI DISTRICT

(The star-marked grasses are described in Ind. For. Records (Botany), Vol. II, No. 1)

BAMBUSAE

Dendrocalamus, Nees

1. Dendrocalamus strictus, ( Roxb.) Nees. Wild in the Margalla Reserve (Parker). The district is too dry for wild bamboos to flourish but a few have been planted in Rawalpindi.

FESTUCAEAE

Bromus, L.

2. Bromus asper, Murray. Trotter collected it at Murree.

3. Bromus japonicus, Thunb. A common weed about roadsides and cultivation in both plains and hills.

4. Bromus japonicus, Thunb. var. falconeri, ( Stapf) R. R. S. This is a variety with more pubescent spikelets and longer divergent awns. Rawalpindi and Peshawar.

5. Bromus mullis, L. Common by roadsides in Murree.

6. Bromus tectorum, L. Only reported from Rawalpindi by Gen. Wingate.

Brachypodium, Beauv.

8. Brachypodium sylvaticum, ( Huds.) Beauv. Murree hills on banks in the forest, resembling Agropyron but the young spikelets are round in cross section and the spikelets are not quite sessile.

Sclerochloa, Beauv.

Poa, L.

10. Poa annua, L. Throughout the area, common. Makes lawns in Rawalpindi in March which soon wither in the heat.

Eragrostis, Beauv.

15. Eragrostis amabilis, ( L) Wight, ( E. tenella, var. plumosa Stapf. Occasionally found as a ruderal in Rawalpindi.
16. *Eragrostis ciliaris*, (All.) Link ex Lutati, Dhamial near Rawalpindi

18. *Eragrostis pilosa*, L. An annual species, common about cultivation in the monsoon. The spikelets are very numerous in flaxuous panicles.

19. *Eragrostis poaeoides*, Beauv. (*E. minor*, Host). This cosmopolitan annual is common throughout the district chiefly about cultivation.

20. *Desmostachya bipinnata*, (L.) Stapf, (*Eragrostis cynosuroides*, Beauv.) 'dub' or 'drab' is a tough perennial pioneer often growing where nothing else can exist even on alkaline soils. Animals usually leave it alone but buffaloes are said to eat it when young.

21. *Dactylis glomerata*, L. Orchard Grass, is common on banks in the Murree Hills. It is usually found above 6,000'.

22. *Lamarckia aurea*, (L) Moench. This Mediterranean species is a dwarf annual with a handsome golden coloured inflorescence. It grows at Attok and in the N. W. F. P.

23. *Arundo donax*, L. 'Nara', 'hans', 'sukna' is occasionally planted in the plains and foothills as a hedge. One of our largest grasses.

24. *Phragmites karoo*, (Retz.) Trin. 'Nal', 'Naria', 'dila' is another very large grass resembling *Arundo*, but it grows near water. In *Arundo* the glumes are silky hairy while in *Phragmites* the rachilla is hairy and the lemmas are naked. Plains and low hills.

25. *Neyraudia arundinacea*, (L) Henr. (*N. madagascariensis*, Hk. f.) This is a large grass, up to 8' tall with tiny spikelets which look undeveloped. -Occasional up to 5,000'.

27. *Agropyron semicostatum*, Nees ex Steud. Apparently very rare in Murree but fairly common in the temperate parts of Kashmir; also reported from Kaghan.
Triticum, L.

Hordeum, L.

29. *Hordeum murinum*, L. Rare about Rawalpindi but fairly common in Murree. An annual weed of roadsides and cultivated land.

Lolium, L.

32. *Lolium multiflorum*, Lam. Italian Rye Grass is stated by Hooker to be cultivated form of the last. It has been collected in Murree and Nathia Gali but it is not cultivated. In *perenne* the lemmas are awnless while in this at least the upper lemma is awned. Both are perennial.

33. *Lolium rigidum*, var. *duthiei* Hack. An uncommon field annual. Has been collected in Jhelum and the type was collected by Duthie in Srinagar, Kashmir.

34. *Lolium temulentum*, L. 'Darnel' is an occasional coarse annual weed in Rawalpindi and Murree. It is often considered to be poisonous but Duthie states that it is edible unless the seeds have been ergotized or diseased.

Pholiurus, Trin.

35. *Pholiurus incurvus*, (L) Schinz and Thell. Rare, only found in Topi Park, Rawalpindi, near a pond.

Aveneae

Schismus, Beauv.

Koeleria, Pers.

38. *Koeleria phleoides* (Vill.) Pers. An unimportant annual weed commonly found in the plains in the spring, also found up to 6,000' in the hills, Edible.

Avena, L.

39. *Avena fatua*, L. False oats is common in grain fields throughout the district. It can be distinguished from true oats by its smaller grain and by numerous rusty hairs on the lemmas.

40. *Avena sativa*, L. Oats, 'jai', is occasionally cultivated about Rawalpindi.

Helictotrichon, Bess

41. *Helictotrichon asperum*, (Munro) Bor, var. *royle*, (Hk. f.) R. R. S. (*Avena aspera*, var. in Fl. Brit. Ind). Occasional in Murree and Khanpur. The genus is near *Avena* but the awns are twisted, not straight.
7

**Agrostideae**

*Calamagrostis*, Adans.

42. *Calamagrostis munroana*, (Aithc. and Hems.) Boiss. An unimportant summer grass, Murree hills, usually above 5,000'.

43. *Calamagrostis pilosula*, (Trin.) Hk. f. Another unimportant temperate summer annual. Changla Gali. This species and the last are placed in *Agrostis* by some botanists but in that genus the flowering glumes are glabrous.

*Agrostis*, L.

44. *Agrostis semiverticillata*, (Forsk.) C. Christ. (*A. Verticillata*, Vill.) Kuldanna, Murree hills.

46. *Agrostis subaristata*, Aitch and Hems. A plant of wet places, near the last but this has a short but definite awn.

*Alopecurus*, L.

*Polypogon*, Desf.

49. *Polypogon interruptus*, H. B. K. (*P. Littoralis*, or *P. fugax*). Fairly common in damp soil in both plains and hills.

*Phleum*, L.

52. *Phleum paniculatum*, Huds. Another spring weed. Abbottabad, Ghora Gali. The empty glumes are not fringed in this while they are in the last species.

*Muhlenbergia*, Schreb.

53. *Muhlenbergia duthieana*, Hack (*M. sylvatica*, of Fl. Brit. Ind.). A summer grass in the hills, usually from 4,000'—9,000'.

54. *Muhlenbergia himalayensis*, Hack. ex Hk. f. Hazara and the Murree Hills, usually from 3,000'—7,000'.

55. *Muhlenbergia hupegeli*, Trin. (*M. viridissima*, Nees), Murree and Dunga Gali, 6,000—9,000'.

*Sporobolus*, R. Brown

57. *Sporobolus coromandelianus*, (Retz) Kunth. A small annual which is not rare in Rawalpindi in the hot weather.

60. *Sporobolus isoelados*, Hk. f. Non. Nees. In a Rawalpindi pond. The species as originally described was based on African specimens and this material may need a new name (Mrs. Chase).

61. *Milium effusum*, L. A temperate forest grass found above 6,000’.

63. *Oryzopsis molinoides*, var. *effusa*, (Hk. f.) R. R. S. Murree Hills. The inflorescence is less strict than in the typical form, being somewhat branched, the spikelets are usually tinged with purple and larger in size.

64. *Oryzopsis munroi*, Stapf. Murree hills, usually above 4,500’. The florets are larger than in the last two and the whole plant tends to be larger.

68. *Aristida cyranantha*, (Nees) Steud. The largest of the genus in our area, forming large tufts on hot rocky or gravelly banks in the foothill zone to about 4,500’. Common along the Jhelum, Darya Gali.

69. *Aristida funiculata*, Trin and Rupr. This is a common monsoon annual about Rawalpindi in the hot weather, sometimes on roofs.

70. *Aristida mutabilis*, Trin. and Rupr. Another plains annual, common in sandy soils in the Punjab but apparently rare in our area.

71. *Aristida hystrix*, L. Reported by Aitchison from Rawalpindi but I have not seen any specimens. His No. 118.

72. *Aristida pogonoptila*, Boiss. Reported from Hasan Abdal by Falconer. This and the last should be checked. I do not have any specimens from this area. It grows at Sargodha and Sangla hill.
73. *Tragus biliorus*, (Roxb) R and S. (*T. racemosus*, Hk. f.) A common: dwarf, annual of the plains and foothills up to 4,000'.

**CHLORIDAE**

74. *Leptochloa chinensis*, (L.) Nees. This species and the next are summer weeds about cultivation. Not common.

75. *Leptochloa filiformis*, (Lam.) Beauv. Like the last but there are 2-3 instead of 4-7 florets per spikelet.

*Tripogon*, Roth.

76. *Tripogon filiformis*, Nees ex Steud. A slender summer annual with a narrow flexuous panicle, Barian, Murree hills, 6.500'.

77. *Tripogon purpurascens*, Duthie (*T. abyssinicus*, of Hk. f.). This is a dwarf perennial forming a close turf on rocky banks, walls or hillsides. Saidpur, Hasan Abdal, Abbottabad, Pipe Line.

**Eleusine**, Gaertn.

78. *Eleusine flagellifera*, Nees. A useful plant of the hot plains, analogous to *Cynodon* but much tougher and more xerophytic with hard and bulbous stem bases. "Chhimbar", 'ghantil'.

79. *Eleusine indica* (L.) Gaertn. An edible annual grass found about cultivation in the plains and lower hills.

80. *Eleusine verticillata*, Roxb. Another ruderal found in the plains in the hot weather. Much like the last but this is awned and the spikes are more scattered. A good fodder.

**Dactyloctenium**, Willd.

81. *Dactyloctenium argyptium*,* (L.) Aschera. and Schweinf. (*Eleusine* in Hk. f.) Another common, weedy, summer ruderal of the plains, said to be a good forage and fodder grass.

82. *Cynodon dactylon*,* (L.) Pers. 'Dab' or 'doob' Bermuda Grass is the best grass for lawns and fodder in the district. It is commonest in the plains but ascends to 8,000'.

**Chloris**, Swartz.

83. *Chloris digitata*, (Roxb) Steud. (*C. incompleta*, Roth) A tall, weedy monsoon grass of the plains, often growing in the protection of bushes. Sometimes grows in the low hills.

84. *Chloris villosa*, (Desf). Pers. (*Tetrapogon villosus*, Desf). A very common perennial on sterile land in the plains, said to be good forage, is abundant on 'usar' soil. (Duthie).
83. **Chloris gayana,** (Kunth) Rhodes Grass is said to be cultivated in Murree but I have seen no specimens.

*Melanocenchris*, Nees

86. **Melanocenchris plumosa**, Jaub. and Spach, Domeli and *Jhelum* (Sultan Ahmad). An unimportant desert grass.

**Phalarideae**

*Phalaris*, L.

87. **Phalaris arundinacea**, L. Reed. Canary Grass, a perennial of wet ground, was collected in Murree by Trotter and the specimen is in the Gordon College Herbarium. Rare.

88. **Phalaris minor**, Retz. A common weed in cultivated ground in the plains and up to perhaps 3,000'.

**Oryzeae**

*Oryza*, L.

89. **Oryza sativa**, L. 'Dhan', 'Chawal', Rice is raised in a few places near streams but the district is too dry for much rice cultivation.

**Melinideae**

*Arundinella*, Raddi

90. **Arundinella nepalensis**, *Trin.* (*A brasiliensis*, Hk. f.). A common perennial with a large panicle superficially resembling *Panicum antidotale* but this has awns. Plains and lower hills. Called 'garali', 'garham' or 'gram' at Tret according to A. G. Bhatti.

**Panicaceae**

*Digitaria*, Heist.

91. **Digitaria bifasciculata**, * (Trin.) Henr (*D. cruciata*, Nees ex Steud) Common in the plains and up to 8,000' often about cultivation. This and the following 'crab grasses' are believed to be excellent for fodder.

92. **Digitaria ciliaris**, (Retz) Koeler, (*Panicum sanguinale*, var. *ciliare*, Hk. f.) Much like the last and found up to 8,000'. The hairs of the mature spikelets are spread out like a fringe on both sides.

93. **Digitaria adscendens**, Henr. Much like *D. bifasciculata*, but the spikes are usually longer and the spikelets are more slender. A plant of the plains, low hills and Murree. Rachis flat, broad.

94. **Digitaria nodosa**, Parl. (*Panicum sanguinale*, var. *pabularc*, Hk. f.) A perennial desert species with woody bulbous roots and pale pubescent spikelets growing in Rawalpindi, Margalla, Saidpur, Hasan Abdal, Jhelum, etc.

95. **Digitaria royleana**, (Nees) Prain. (*Paspalum* in Fl. Brit. Ind.) The smallest of the genus in our area. The heads are very small and numerous, the seeds black and the hairs on the spikelets have calvata tips. Pubescence mealy. Rawalpindi in the hot weather.

97. *Brachiaria ramosa*, (L) Stap. (*Panicum ramosum*, L. or *P. pectinacea*, Trin). This is a good fodder and is common in the plains and lower hills in the hot weather.

100. *Paspalum distichum*, L. This is another good fodder grass and is common about ponds and wet places. The spikes are almost always in pairs.

102. *Panicum antidotale*, Retz. A perennial, common all over the plains in hedges and among bushes, up to 5' tall and with solid woody, terete, polished stems. Opinions differ as to its fodder value (Duthie). Inferior as fodder even when gummy (F. M. K.), said to be an antidote for hydrophobia (BOR).

104. *Panicum miliaceum*, L. ‘Cheena’, ‘cheeni’, ‘chinwa’. This millet is occasionally found in the district but is not an important crop.

106. *Isachne*, R. Br.

107. *Isachne himalaka*, Hk., f. Material from Rawalpindi may represent a new species according to Mrs. Chase of the Smithsonian Institution. Rare.

108. *Opismenus undulatifolius*, (Ard) Beauv. An unimportant grass, not uncommon in the Murree Hills. The genus suggests *Panicum* but as Duthie points out both glumes are awned while in *Panicum* the outer glume is never awned. In this species, the spikelets are fascicled on a simple, terminal spike.
Echinochloa, Beauv.

109. *Echinochloa colonum*, (L) Link, 'sawak', 'saumak' is a coarse, common grass of the plains and lower hills. It is excellent fodder and according to Duthie there is sale for the seeds in Rawalpindi. Common in cultivated fields in the monsoon.

110. *Echinochloa crusgalli*, (L) Beauv. 'Bura sawak', barnyard grass is usually coarser than the last and usually with much longer awns. It favours wet places and in Kashmir is common at the edges of rice fields. A good fodder, green or dry.

111. *Echinochloa frumentacea*, (Roxb) Link. 'Saumak', 'saumun' is often cultivated for its seed in the Punjab and Kashmir hills and is to be expected in this area.

Tricholoma, Schrad.

112. *Tricholoma tomuricinum*,* (L. f) Parl. I have specimens of this Mediterranean xerophytic grass from Hasan Abdal on lime-stone, from Attock and the N. W. F. P.

Setaria, Beauv.

113. *Setaria italica*, (L) Beauv. 'Kangri', 'charrri', (Jhelum basin. *Duthie*) Italian millet is commonly cultivated in the Himalayas especially in the inner valleys.

114. *Setaria latifrons*, (Weigel) Hubbard, (S. glauca, Beauv.) 'Bantra', 'bandri', 'ban kangri'. Foxtail is one of the commonest weeds about cultivation in both plains and hills. The awns are rust coloured and the fruitlets are transversely wrinkled. An edible grass.

116. *Setaria verticillata*, (L) Beauv. Another subtropical weed preferring shady places. The barbs on the bristles point backwards and the inflorescences become tangled and stick together. It is a coarse grass but is eaten when young. It seems to be spreading in Rawalpindi.

117. *Setaria viridis*, (L) Beauv. Another cosmopolitan, subtropical and temperate weed resembling *lutescens* but the false spikes are green and the young fruits are not transversely wrinkled. It will grow on the bare soil of landslides. Abbottabad and the Murree hills.

Pennisetum, Pers.

118. *Pennisetum flaccidum*, Girseb. A temperate roadside grass with a slender, flexuous fox tail like inflorescence. Usually above 6,000'.

119. *Pennisetum orientale,* Rich, 'Maniara' in Tret. A common perennial with the inner bristles copiously ciliate. From 2,000—7,000'.
120. *Pennisetum glaucum*, (L.) R. Br., (*P. typhoides* or *typhoides*) *Bajra* bullrush or spiked millet is a very common hot weather crop on unirrigated land in the plains.

*Cenchrus*, L.

121. *Cenchrus barbatus*, Schum. *'Bhart', 'bharat'. The rigid involucel spines make it a pest when ripe but it is considered to be a good fodder when young.

123. *Cenchrus setigerus*, Vahl. (*C. hisloides* Roxb.) A valuable desert fodder grass with the same names as the last (*Gorrie*). Fairly common in the plains.

**Andropogoneae**

*Imperata*, Cyrillo.

124. *Imperata cylindrica*,* (L) Beauv. Cotton grass is easily recognized by its pure white cylindrical spike-like panicles of silky spikelets. It is found on wet or waterlogged soil in all warm countries and furnishes good pasture when young. Called "kai" in Tret according to Bhatti.

*Saccharum*, L.

125. *Saccharum officinarum*, L. Very little sugar-cane 'ganna), is raised in Rawalpindi but a good deal is raised about Hasan Abdal.

126. *Saccharum spontaneum*, L. This is a large, gregarious grass, very common near water in the monsoon. It is a poacher in land ruined by torrents and is invaluable in reclamation work though it may be a nuisance in cultivated ground. The inflorescence is white and the ripe fruits are deciduous, leaving naked stalks. "Kan", "kons", "kahi". A plant of the plains and lower hills.

127. *Saccharum bengalense*, Retz. (*S. munja* or *S. sara* or *S. arundinacum*) 'Kana' or 'sarkanda'. One of our largest grasses, abundant on the flood plains of the great rivers of the Punjab and along water courses. It grows in great clumps which may attain 15' height. The different parts of the plant have separate names and many uses for matting, ropes, sercines, sieves, etc. Only the young leaves are tender enough for fodder. Like the last it is useful as a soil binder.

*Erianthus*, Michx.

128. *Erianthus filifolius*, Nees ex Hack. Murree and the Gallies, usually above 5,000'; a strong perennial grass with very long and slender leaf tips and reddish inflorescence.

129. *Erianthus griffithii*, (Munro) Hk. f. A xerophytic analogue of *Saccharum bengalense*. It grows in great clumps on dry banks and hills with a handsome white fluffy inflorescence ripening after the close of the rains.
Eulalia, Kunth.

130. *Eulalia nuda*, (Trin.) Kuntze, (*Pollinia nuda*, Trin.). An inconspicuous grass in the Murree Hills from perhaps 4,000—7,000'.

Eulaliopsis, Honda.

131. *Eulaliopsis binata,* (Retz.) Hubbard, (*Ischaemum angustifolium*, Hack.) 'Bhabbar' is abundant enough in the district to be of economic importance. (F.M.K.) It is a plant of dry, rocky places in the outer hills and is useful for paper making. The white wool at the swollen bases of the secondary tufts is distinctive.

Arthroxon, Beauv.

132. *Arthroxon, hispidus*, (Thunb.) Makino, (*A. ciliaris* Beauv.) Kahuta, Abbottabad. An unimportant grass usually found below 5,000'.

133. *Arthroxon lanceolatus*, (Roxb.) Hochst. Another summer grass, 2,000'—8,000'.

134. *Arthroxon lancifolius*, (Trin.) Hochst. A dwarf, annual grass, usually from 4,000'—8,000' on banks and walls.

Pogonatherum, Beauv.

135. *Pogonatherum panicenum*, (Lam.) Hack. A slender grass bearing simple spikes often forming a turf in the outer hills on steep ground below springs or water courses from the plains to 6,000'.

*Ischaemum*, L.

136. *Ischaemum* sp. An undetermined species has been collected at Khanna near Rawalpindi.

Apluda, L.

137. *Apluda arista*,* L. Chhat or chhant* is one of the commonest grasses in the hills up to 7000'. It is often scendent. It is much used for hay.

Themeda, Forsk.

138. *Themeda anathera,* (Nees) Hack ‘Loonder’, ‘bunji’ is exceedingly abundant in the low foothills and up to 7,500'. It is a good fodder grass.

Isilema, Anders.

139. *Isilema laxum,* Hack. 'Chhat' is a low weak grass on low lying land in good soil. Uncommon but a good fodder. Reported from Rawalpindi by Duthie. I have not seen any specimens.

Bothriochloa, Kuntze.

140. *Bothriochloa ischaemum*, (L.) Keng (*Andropogon ischaemum*, L.) ‘Palwan’ is one of our commonest perennials and is found from the plains to 11,000'. It is a good fodder grass but a nuisance on a lawn.

141. *Bothriochloa pertusa,* (L. A. Camus), *Andropogon pertusus*, Wild.) This is much like the last but the lower glumes of the sesaile spikelet have peculiar pits. Usually below 6,000'. This is a good fodder grass.
142. *Dichanthium annulatum*, (Forsk.) Stapf, *(Andropogon annulatus*, Forsk.) ‘Palwan’, (Tret.—vide Bhatti). This is another excellent fodder grass closely resembling the last two species and it can be recognised by the peculiar, regular over lapping of the scales like those of a snake and blunt glumes with hairs having enlarged bases. A plant of the plains and low hills

*Eremopogon*, Stapf.

143. *Eremopogon forcolatus*, (Del.) Stapf. *(Andropogon forcolatus*, Del.)

This is abundant on sandy and rocky ground in the plains and is usually reckoned a good fodder grass. (Duthie). This resembles the last three grasses listed, but the spikes are solitary and the glumes are pitted.

*Cymbopogon*, Spreng.

144. *Cymbopogon distans*, (Nees) Watson, *(Andropogon distans*, Nees). An odoriferous grass growing between 4,000' and 8,000'. Ghora Gali Murree, Barian, etc. The panicles are deflexed and the leaves filiform and long tipped.

145. *Cymbopogon jwarancusa*, (Jones) R. and S. *(Andropogon jwarancusa*, Jones) *Bur*, (khavi). This is a common scented grass in the plains and low hills. The raceme fascicles are densely congested and hairy. The leaf bases are flat, the older ones curled. The plant takes a brownish red colour when ripe.

146. *Cymbopogon martini*, (Roxb) Watson, ‘Rauns’ (Bhatti). Rusa Oil Grass. Much the largest of the genus, the leaf bases are broad and semi amplexicaul. Occasional from 2,000’—4,000’. Rawalpindi, Tret.

147. *Cymbopogon schoenanthus*, (L.) Spreng. *(Andropogon schoenanthus*, L.) “Rusa ka tel” (Duthie) Lemon scented and thought to be a poor fodder, often growing on low lying ground. It is sometimes hard to distinguish from *C. jwarancusa* and there may be hybridization. The basal sheaths are in dense tufts, tightly clasping, thickened below, and the blades are more or less filiform and flexuous, except when very short. Common about Rawalpindi.

*Veteveria*, Thouras ex Virey.

148. *Veteveria zizanioides*, (L.) Nash, *(Andropogon squarrosus* Hack.) ‘Khas khas’ grass. This is the well known grass which furnishes an oil for perfumery and roots for ‘khas khas’ tatties. It grows in low lying damp ground and is relished by buffaloes when young. The seabrid spikelets are distinctive. A plains plant.

*Sorghum*, Monarch.

149. *Sorghum halepense*, (L.) Pers., *(Andropogon halepense*, Brot.) ‘Baru’ Johnson Grass, is a large troublesome grass in cultivated ground in the hot weather. It is very quick growing and considered by many to be a fine grass for fodder but under certain circumstances it seems to be harmful. Some state that it is poisonous when frosted and during drought. Common up to 5,000'.
150. *Sorghum nitidum*, (Vahl) Pers., *(Andropogon servatus*, Thunb.)* var. nitidus*, Hack. ‘Barwani’ *(Bhatti)* ‘chhota baru’. This closely resembles the last but is smaller and the smaller fruits are very dark in colour. In this the primary branches of the panicle are up to 4 in long and undivided while in the last they are branched and up to 8 in long. A plant of the low hills.

151. *Sorghum vulgare*, Pers. *(Andr. sorgbham*, Brot.)* ‘Jowar’ is one of the most important summer crops in the plains. When specially grown for fodder it is called *churi*.

*Chrysopogon*, Trin.

152. *Chrysopogon montanus*,* Trin. Dhauli
153. *Chrysopogon fulvus*, (Spreng). Chioe. *(Andr. monticola*, R. and S.)* Common in the plains and low hills and the size of the spikelets is very variable. The fodder is said to be good for horses.

155. *Chrysopogon fulvus*, var. *serrulatus* *(Trin.)* R. R. S. This variety usually has smaller florets but there seem to be intermediates which *Trinillus* separated as a distinct species. The intermediates may be hybrids. This group needs more study. Plains to 7,000'.

156. *Chrysopogon gryllus*,* (L.) Trin., *(Andr. gryllus*, L.)* Very common in the hills from 5,000—9,000’. It is very variable and Hackel has divided it into sub species and varieties. According to Osmaston it is the best of thatching grasses. The panicles are erect, narrow and reddish and it is common on banks in open places.

*Heteropogon*, Pers.

157. *Heteropogon contortus*,* (L.) Beauv. *(Andr. contortus*, L.)* ‘Suriala’, ‘surwala’. Spear grass is probably the commonest monsoon grass in the low hills. It is a good fodder but it must be harvested before the barbs are ready or when they are ripe enough to be shaken out, (Gorrie). The awns adhere in masses when the plants are mature.

*Rottboellia*, L. f.

*Phacelurus*, Griseb.

*Muesithea*, Kunth.

160. *Muesithea leavis*, *(Retx.)* Kunth, *(Rottboellia perforata*, Roxb.)* A subtropical grass found up to about 4,000'. It has a very slender spike with pairs of sessile spikelets, appressed when young and a ring at their base. The
glumes are without veins and have a polished appearance. Grows on low lying pasture land and is edible.

*Hemarthria*, R. Brown.

161. *Hemarthria compressa*, (L. f.) R. Br. (*Ruttboellia compressa*, L. f.) ‘phalila’ (Bhatti). Much like the last but the spikelets are not paired and the veins on the glumes seem to be partly rubbed off. Also a plant of wet soil at low elevations.

162. *Hemarthria compressa*, var. *fasciculata*, Hack. Aitoniision No. 252 from Rawalpindi has been identified as the variety. Duthie considered the variety to be only a form with shorter leaves and shorter, more crowded spikes.

*Lasius Boiss.*

163. *Lasius hirsulus*, (Forsk.) Boiss. (*Elionurus hirsulus*, Munro). A handsome zerophytic grass with a white silky inflorescence and a hard coespitose rhizome. An excellent fodder grass except when old when it is good for thatching (Duthie). Common on sandy and stony ground, Peshawar, Rawalpindi, etc.

*Hackelochloa, Kuntze.*

164. *Hackelochloa granularis*, (L.) Kuntze, (*Manisurus granularis*) L. f. Atropical annual growing in the monsoon in the plains and outer hills. The plant is hairy and has distinctive granular, bead like fruits which become dark when ripe.

**Maydeae**

*Coix, L.*

165. *Coix lacryma-jobi*, L. This is a large water grass only found at Wah near Hasan Abdal in Attock District. The white, hard, shell, or bead like involucres are known as 'Job's tears' and are said to be eaten in Burma and China.

*Chionachne, R. Br.*

166. *Chionachne kornigii,* (Spreng) Thw., (*Polytoxa barbata*, (Roxb.) Stapf. Another large grass found in the Tret hills near the bands of cultivated fields. The leaves and sheaths are armed with long stiff bristle like irritant hairs. The hard white polished stone-like fruit-cases resemble those of Coix but are smaller, roughly half the size.

*Zea, L.*

167. *Zea mays*, L. Maize, (*makki*), is an important monsoon crop everywhere in the Murree hills and is also commonly cultivated in the plains. More productive types would be tried.

(Added)

*Catapodium*

# GRASSES OF RAWALPINDI DISTRICT

## INDEX

*Marked grasses are described in Indian Forest Records (Botany) Vol. II No. 1
