# MEMORANDUM ON THE COMPILATION 

OF

MAP OF A PORTION OF

## TIBET

Explored by Captain H. H. P. Deasy, 16th Lancers,

IN
1896.

DEHRA DÚN :
printed at the office of the trigonometrical branch, survey of india.
1897.

# MEMORANDUM ON THE COMPILATION OF CAPTAIN DEASY'S MAP. 

## LATITUDES.

The Observed Latitudes have been accepted and used throughout.

## LONGITUDES.

CAMP 1. Lat. $34^{\circ} 23^{\prime} 23^{\prime \prime}$, loug. $79^{\circ} 34^{\prime} 28^{\prime \prime}$. The longitude was computed in terms of peak E. 31, (identical with G. T. Tartary No. 1 peak, vide Synoptical Volume VII) and from it the longitudes of S. P. 9 and S. P. 6 were computed by means of Captain Deasy's traverse to the Lamak La.

CAMP 3. Lat. $34^{\circ} 27^{\prime} 3^{\prime \prime}$, long. $79^{\circ} 58^{\prime} 25^{\prime \prime}$. The longitude was first computed in terms of S. P. 11, 12 and 18 which were believed to be ilentical with the G. T. points Mangtza Lake Nos. 3, 2 and 1 , but the three resulting values were $79^{\circ} 56^{\prime} 1^{\prime \prime}$, $79^{\circ} 57^{\prime} 27^{\prime \prime}$, and $79^{\circ} 58^{\prime} 47^{\prime \prime}$.

The Longitude of S. P. 9 was now worked out through the triangle to S. P. 9, using each of these values. That deduced, using the value from S. P. 18 agreed within $6^{\prime \prime}$ with the value of S. P. 9 brought up from camp l, through traverse and triangulation. The value of S. P. 6 similarly worked agreed fairly well. This was taken to prove the ideutity of S. P. 18 with G. T. peak Mangtza Lake No. 1 and the corresponding value of camp 3 was accepted.

All the G. T. points here referred to have been fixed by only 2 rays so their G. T. values cannot be cousidered absolutely reliable.

CAMP II. Lat. $34^{\circ} 35^{\prime} 17^{\prime \prime}$, long. $81^{\circ} 9^{\prime} 22^{\prime \prime}$. The longitude of this camp was computed through S. P. 6 which is fixed by triangles from both camp 3 and camp 1l. The peak is a promineut one and Captain Deasy says there cau be no doubt alout its identification. The peak is, however, ouly fixed ly a siugle triangle so the value is unchecked. S. P. 14 was also tried but proved to be doubtful with a difference of $2^{\prime} 10^{\prime \prime}$ in latitude and $1^{\prime} 33^{\prime \prime}$ in longitude.

As there was no trigonometrical comnection between carop 11 and any of the subsequent camps, a fresh commencement was made at the closing end of Captain Deasy's work.

CAMP 74. Lat. $34^{\circ} 3^{\prime} 43^{\prime \prime}$, long. $79^{\circ} 43^{\prime} 1^{\prime \prime}$. The lougitude was computed from peak E. 32 , which is the same as G. T. Tartary No. 2 peak.

Then from camp 74 the value was carried through peak 256 to camp 67 , but when the latitude of C. 67 thus brought up was compared with its observed latitude a differeuce of $l^{\prime} 38^{\prime \prime}$ was found, so peak 256 was rejected and camp 74 stands by itself, there being no connection with any other camp.

CAMP 63. Lat. $33^{\circ} 59^{\prime} 40^{\prime \prime}$, long. $80^{\circ} 47^{\prime} 51^{\prime \prime}$. The longitude of this camp was computed by means of au azimuth taken to S. P. 6 from the camp which lay well to the south of the peak, and by the difference of latitude of the peak and the camp.

CAMP 67. Lat. $33^{\circ} 54^{\prime} 53^{\prime \prime}$, long. $80^{\circ} 29^{\prime} 44^{\prime \prime}$. The longitude was computed from camp 63 ly azimuths and difference of latitudes through peaks 220,232 and 28 as below:-

The longitudes through peaks 220 and 28 agreed within $37^{\prime \prime}$, so their menin was accepted, the value through peak 232 being discordant was rejected.

## COMPUTATION OF CAPTAIN DEASY'S HEIGHTS.

As the G. T. peaks on which Captain Deasy's longitudes have been based have not had their heights determined, it was necessary to obtain a fundamental height barometrically, on which to base the height computations.

Captain Deasy while at Leh read his Mercurial Barometer at Leh station, the height of which is known. He did not however compare his Barometer with that used at the Meteorological observatory there, the records of which for $10 \mathrm{~A} . \mathrm{m}$. and 4 p.m. daily are available. He states lowever that the situation of the Meteorological Instrument was within some 15 or 20 feet in height of Leh Station where he read his Barometer. I have therefore assumed the two points to be identical. The reading of Captain Deasy's Barometer in May was somewhat higher than that of the Meteorological instrument, but on his return journey the readings were almost identical.

I have worked out Captain Deasy's heights differentially with Leh, using his readings and those recorded at Lel.

The Leh records are made at 10 a.m., and 4 p.m., while Captain Deasy on account of the exigencies of marching observed at 7 A.m., and 9 p.m.

No hourly record was kept from which the hourly variation could be ascertained, so an assumed hourly correction was at first applied. As this made the results generally more discordant, and as clearly the changing weather was the greatest element in the irregularities, I finally compared the mean of the readings at each place with the similar mean at Leh.

To determine the fundamental height the procedure has been as follows:-
(1) The heights of all base camps were computed Barometrically, differentially from Leh.
(2) With the Barometrical value of camp 3 as an initial value the heights of camps $63,67,61,57$, 58 and 51 were computed through the triangulation. The heights thus determined in terms of camp 3 were compared with the Barometric heights of these camps and the latter were found lower than the former by various amounts, the average of which was 60 feet. This amount was therefore applied as a correction to the trigonometrical heights. In other words the fundamental height is obtained by taking the mean barometric height of $\boldsymbol{7}$ stations the differences of height of which had been obtained trigonometrically.

The heights were then extended as far as possible trigonometrically, the co-efficient of refraction being taken as 06 .

Such camps as were not connected by triangulation have had their heights detormined direct from the Barometer observations.

The Barometric observations when computed gave as a rule the usual discrepancies inter se of from 30 to 60 feet.

St. G. C. Gore, Lieut.-Colonel, r.e,
Superintendent, Trigonometrical Surveys.

Latitudes, Longitudés, Heights and Magnetic Declination at Captain Deasy's Camps.
